Activity: Writing a Troubleshooting Guide for Input, Output, Storage, and Processing Systems

Instructions:

1. **Context: Imagine you work in the IT department of a company, and your task is to write a troubleshooting guide for common problems related to Input, Output, Storage, and Processing systems. This guide will help users solve issues with hardware or software related to these processes.**

2. **Part 1: Vocabulary Introduction Review and familiarize yourself with the following key terms:**

   - **Input devices (e.g., keyboard, mouse, scanner): Devices used to input data into a system.**
   - **Output devices (e.g., monitor, printer, speakers): Devices that output data from the system to the user.**
   - **Storage (e.g., hard drive, SSD, cloud storage): Where data is stored for long-term use.**
   - **Processing (e.g., CPU, GPU): The part of the system that processes data.**

Example sentences:

- **"The input device is not working because the computer does not detect the keyboard."**
- **"If the output device is malfunctioning, the monitor might display a blank screen."**
- **"If there is no space in the storage, the system will not save new files."**

- **"The processor will slow down if it overheats."**

3. **Part 2: Structure of the Troubleshooting Guide Write a troubleshooting guide to help users identify and fix problems with input, output, storage, and processing systems. The guide should be structured as follows:**

    - **Introduction: Briefly describe the purpose of the guide (e.g., helping users fix problems with their devices).**
    - **Step-by-step Solutions: Use conditionals to guide users through possible solutions.**
    - **Conclusion: Provide additional recommendations or tips for maintaining the system.**

4. **Part 3: Using Conditionals You must use at least five conditionals (Zero, First, and Second Conditionals) in your step-by-step solutions. Each conditional should describe a specific issue and its possible solution.**

Examples:

- **Zero Conditional (for factual statements): "If the keyboard is not connected, the system doesn't receive input."**
- **First Conditional (for likely situations in the future): "If you restart the system, the processor will cool down."**
- **Second Conditional (for hypothetical situations): "If I were you, I would check if there's enough storage space before saving the file."**

5. **Part 4: Writing Your Guide Write your own troubleshooting guide, ensuring you use the structure provided and include the appropriate conditionals. Each problem should relate to input, output, storage, or processing systems. (100-120 words)**

Example Steps:

- **Input problem: "If the mouse is not responding, check if the USB port is working."**
- **Output problem: "If the monitor shows a blank screen, you will need to check the video cable."**
- **Storage problem: "If the hard drive is full, the system won't save new files."**
- **Processing problem: "If the CPU is overheating, the system might shut down unexpectedly."**

6. **Part 5: Peer Review Exchange your troubleshooting guide with a classmate. Review each other's work, focusing on:**
   - **Correct use of conditionals.**
   - **Clarity of the instructions.**
   - **Proper use of technical vocabulary (Input, Output, Storage, Processing).**
7. **Part 6: Optional Oral Presentation Present your troubleshooting guide to the class.**

Evaluation Criteria:

- **Correct use of Zero, First, and Second Conditionals.**
- **Clear and logical structure of the troubleshooting guide.**
- **Effective use of technical vocabulary related to Input, Output, Storage, and Processing.**

Example of a Troubleshooting Guide:

Introduction:
This guide will help you troubleshoot common problems related to input, output, storage, and processing systems. Follow the steps below to resolve these issues.

Step-by-step Solutions:

1. Input Devices (Keyboard, Mouse)

- If your keyboard is not responding, check if the USB connection is secure.
- If the mouse isn't moving, try using a different USB port. The mouse will work if the port is functioning.

2. Output Devices (Monitor, Printer)

- If the monitor displays nothing, check the power supply and the video cable.
- If the printer is not printing, you might need to check if the printer has enough paper.

3. Storage (Hard Drive, SSD)

- If the system does not save new files, it's because the storage is full. Delete some files or increase storage capacity.

4. Processing (CPU, GPU)

- If the system is running slowly, the processor might be overheating. Clean the fan or improve ventilation to prevent damage.

Conclusion:
To keep your system running smoothly, regularly check your input, output, storage, and processing components. Backup your data frequently and clean your devices to prevent overheating.
