
Multiple Choice Questions

1. What is the primary purpose of cybersecurity tools?
 - a) To improve software performance
 - b) To protect systems, networks, and data from cyber threats
 - c) To manage computer hardware
 - d) To develop network protocols
2. Which tool scans and removes malicious software?
 - a) Firewall
 - b) Intrusion Detection System
 - c) Antivirus software
 - d) Forensic tools
3. What does a Host Intrusion Detection System (HIDS) monitor?
 - a) Network traffic
 - b) Cloud services
 - c) A single host for suspicious activity
 - d) File-level encryption
4. Which type of firewall protects entire networks?
 - a) Host-based firewall
 - b) Network firewall
 - c) Application firewall
 - d) Email firewall
5. What is the purpose of encryption tools?
 - a) To block spam emails
 - b) To monitor network traffic
 - c) To convert data into unreadable code for protection
 - d) To automate software patching
6. What do incident response platforms provide?
 - a) Memory dump analysis
 - b) Automated workflows for managing security incidents
 - c) Network traffic analysis
 - d) Cloud storage management
7. What is a key feature of Identity and Access Management (IAM) systems?
 - a) Data encryption
 - b) Monitoring network performance
 - c) Controlling access to resources
 - d) Automating system backups
8. What does single sign-on (SSO) allow users to do?
 - a) Encrypt email communications
 - b) Authenticate once and access multiple systems
 - c) Analyze log data from various systems
 - d) Simulate cyberattacks
9. Which tool continuously monitors networks for performance issues and security threats?
 - a) Patch management tools
 - b) Log management tools
 - c) Network monitoring tools
 - d) Endpoint protection platforms

10. Which tool automates the process of patching software to fix vulnerabilities?
- a) Threat detection software
 - b) Patch management tools
 - c) Backup and recovery tools
 - d) Security assessment tools
11. What does cloud data loss prevention protect?
- a) Data at rest
 - b) Data in motion across networks
 - c) Data stored and processed in cloud services
 - d) Endpoint data
12. What is the purpose of penetration testing tools?
- a) To create backups
 - b) To simulate attacks and identify vulnerabilities
 - c) To monitor network performance
 - d) To encrypt sensitive data
13. What do configuration assessment tools check for?
- a) File encryption
 - b) Security best practices and compliance
 - c) Data backups
 - d) Endpoint security
14. What does a disaster recovery tool do?
- a) Encrypt hard drives
 - b) Recover data and systems after cyber incidents
 - c) Simulate cyberattacks
 - d) Monitor log activity
15. Which of the following is an example of an endpoint protection platform?
- a) Wireshark
 - b) Nessus
 - c) Antivirus software
 - d) Forensic tools
16. What is the main function of a Security Information and Event Management (SIEM) system?
- a) Analyze activity from multiple resources to identify threats
 - b) Provide memory dump analysis
 - c) Encrypt files and folders
 - d) Simulate phishing attacks
17. What is full-disk encryption used for?
- a) Encrypting individual files only
 - b) Encrypting all data on a hard drive
 - c) Monitoring endpoint activity
 - d) Logging network performance
18. What is a key feature of multi-factor authentication?
- a) Encrypting email communications
 - b) Requiring two or more verification factors for access
 - c) Automating security patch updates
 - d) Providing disaster recovery options
19. What is a common use of forensic tools in cybersecurity?
- a) Encrypting hard drives

- b) Collecting and analyzing data from networks to understand incidents
 - c) Monitoring endpoint activity
 - d) Patching vulnerabilities
20. Which tool can identify security weaknesses in networks?
- a) Endpoint protection platforms
 - b) Vulnerability scanners
 - c) Incident response tools
 - d) Log management tools
21. What type of encryption protects individual files or folders?
- a) Disk-level encryption
 - b) File-level encryption
 - c) Cloud encryption
 - d) Endpoint encryption
22. What is a primary use of log management tools?
- a) Encrypting sensitive data
 - b) Collecting and analyzing log data from systems
 - c) Recovering lost data
 - d) Monitoring network performance
23. What does privilege access management control?
- a) User authentication methods
 - b) Access for privileged users to specific systems and data
 - c) Email encryption protocols
 - d) Log data storage
24. Which tool helps prevent sensitive data from being misused or accessed by unauthorized users?
- a) Data loss prevention tools
 - b) Endpoint security platforms
 - c) Threat detection software
 - d) Patch management tools
25. Which example represents a network data loss prevention tool?
- a) Monitoring cloud data
 - b) Protecting data in motion across a network
 - c) Encrypting hard drives
 - d) Automating backups
26. What is the role of backup software?
- a) Encrypting data
 - b) Creating copies of data regularly
 - c) Analyzing logs
 - d) Scanning for vulnerabilities
27. What is an example of a monitoring tool used for analyzing network traffic?
- a) Nessus
 - b) Wireshark
 - c) Burp Suite
 - d) Splunk
28. What is the purpose of a secure email gateway?
- a) To encrypt email contents
 - b) To block phishing and spam emails
 - c) To analyze email metadata

- d) To simulate phishing attacks

29. What is an endpoint in the context of endpoint protection platforms?

- a) A server
- b) A desktop, laptop, or mobile device
- c) A router
- d) A database

30. What is the role of disaster recovery tools?

- a) Simulating security breaches
 - b) Automating the recovery of data and systems
 - c) Encrypting cloud data
 - d) Monitoring network activity
-
